

Notes (handled per item, not drawn as fragments):

- If there are no products to restock -- return an empty summary ("No products need restocking").
- Pass 1: if the product or a supplier can't be resolved -- record an error and skip that product. If $\text{net} \leq 0$ -- skip (enough is already on the way).
- Pass 2: if an order can't be created -- record an error and skip that supplier.
- The supplier identifies products by NAME; order lines keep the store's product id.
- "Already on the way" counts only open shortage orders (scheduled / periodic orders are excluded).
